WEEK 4 : DEPLOYMENT ON FLASK

Name: Abhimanyu Gangani

Batch Code: LISUM15

Submission Date:

Submission To: Data Glacier

1. Creating a model using sklearn library:

```
# Importing the libraries
import numpy as np
import matplotlib.pyplot as plt
import pandas as pd
import pickle
dataset = pd.read_csv('diabetes.csv')
df.fillna(df.mean(),inplace=True)
X = df.iloc[:, :5]
y = df.iloc[:,-3]
#Splitting Training and Test Set
#Since we have a very small dataset, we will train our model with all available data.
from sklearn.linear_model import LinearRegression
regressor = LinearRegression()
#Fitting model with trainig data
regressor.fit(X, y)
# Saving model to disk
pickle.dump(regressor, open('model.pkl','wb'))
# Loading model to compare the results
model = pickle.load(open('model.pkl','rb
print(model.predict([[0,145,70,30,50]]))
```

2. Creating a flask application using python library

```
import numpy as np
from flask import Flask, request, jsonify, render_template
import pickle
app = Flask( name
model = pickle.load(open('model.pkl', 'rb'))
@app.route('/')
def home():
    return render_template('index.html')
@app.route('/predict',methods=['POST'])
def predict():
    For rendering results on HTML GUI
    float_features = [float(x) for x in request.form.values()]
    final_features = [np.array(float_features)]
prediction = model.predict(final_features)
    output = round(prediction[0], 2)
    return render_template('index.html', prediction_text='DiabetesPedigreeFunction should be {}'.format(output))
@app.route('/predict_api',methods=['POST'])
def predict_api():
    For direct API calls trought request
    data = request.get_ison(force=True)
    prediction = model.predict([np.array(list(data.values()))])
    output = prediction[0]
    return jsonify(output)
            == "__main_
     name
    app.run(debug=True)
```

3. Creating the request file:

```
import requests
url = 'http://localhost:5000/predict_api'
r = requests.post(url, json={'Pregnancies':1, 'Glucose':143, 'BloodPressure':75, 'SkinThickness':35, 'Insulin':87})
print(r.json())
```

4. Create a HTML file and save it to Templates folder in same folder where python files are located:

```
<!DOCTYPE html>
<html >
<!--From https://codepen.io/frytyler/pen/EGdtg-->
  <meta charset="UTF-8">
<title>ML API</title>
k href='https://fonts.googleapis.com/css?family=Pacifico' rel='stylesheet' type='text/css'>
k href='https://fonts.googleapis.com/css?family=Arimo' rel='stylesheet' type='text/css'>
k href='https://fonts.googleapis.com/css?family=Hind:300' rel='stylesheet' type='text/css'>
<link href='https://fonts.googleapis.com/css?family=Open+Sans+Condensed:300' rel='stylesheet' type='text/css'>
<link rel="stylesheet" href="{{ url_for('static', filename='css/style.css') }}">
</head>
<body>
 <div class="login">
          <h1>Predict Salary Analysis</h1>
      <!-- Main Input For Receiving Query to our ML -->
     <form action="{{ url_for('predict')}}"method="post">
         <input type="text" name="Insulin" placeholder="Insulin" required="required" />
          <button type="submit" class="btn btn-primary btn-block btn-large">Predict</button>
     </form>
    <br>
    {{ prediction_text }}
 </div>
</body>
</html>
```

5. Create css file for styling in static/css folder as style.css:

```
@import url(https://fonts.googleapis.com/css?family=Open+Sans);
.btn { display: inline-block; *display: inline; *zoom: 1; padding: 4px 10px 4px; margin-
